

The trip that *looks after* itself.

LuxSav Companion is a travel app that doesn't stop at checkout. It runs the journey — re-planning the day when things change, filling free time with experiences that genuinely fit, and showing the true price of everything, even where there is no signal.

*Other apps sell you a trip.
LuxSav runs it.*

Every travel app ends at checkout. LuxSav starts there.

Booking platforms compete at the moment of purchase — inventory, photos, price. After that the traveller is on their own with PDF vouchers, WhatsApp threads and a driver who may or may not be outside arrivals. The days that matter most, the ones actually spent travelling, belong to no one.

LuxSav Companion claims those days. The itinerary stops being a document and becomes a live object that knows the time, the weather, the party, the budget and the free hours — and acts on them.

FOUR SHIFTS

A static itinerary, rebuilt by phone when plans break	→ A living day that re-plans itself
A catalogue the traveller has to search	→ Experiences sold into the traveller's actual free time
"From US\$X per person", corrected on the invoice	→ The true all-in price for this exact party
An app that only talks to the traveller	→ A traveller and a lodge looking at the same trip

Book once. Then let the trip run itself.

WHY LUXSAV IS UNUSUALLY WELL PLACED

1,449 Itineraries already generated by Tanova, day by day, with time slots	248 Live experiences, each with duration, part-of-day and party-size limits	32 Supplier pricing models catalogued across 43 properties' 2027 rates	1 Shared platform linking LuxSav with its operator portal
--	---	--	---

Most platforms would need to build these assets before they could attempt the features in this plan. LuxSav already has them — they are simply not yet connected to a traveller's phone.

WHO WINS

The traveller Fewer surprises at the lodge, no anxiety at the border, and free time that becomes the best part of the trip instead of dead hours.	The lodge & operator Late arrivals, dietary needs and changes known before the guest walks in — not discovered at the front desk.	LuxSav Revenue from time the guest has already paid to be in, a reason to open the app every day, and the context to sell the next trip.
---	---	--

Six signature experiences

A UI kit can give LuxSav a good-looking hotel app. None of these come in a kit. They are what a traveller will tell other travellers about — and what the industry will notice.

01

Living Itinerary

The day re-plans itself when a flight slips, rain rolls in or the group is running late — and asks the guest one question.

Built on Tanova's day plans, which already carry duration and part-of-day for every item

02

Gap Commerce

A free afternoon becomes a one-tap experience that fits the hours, the party and the budget left.

Built on live search by time window, party size and budget — already running on luxsav.com

03

True Price

Every quote is the real total for this party — levies, park fees, supplements and child rates included.

Built on 32 pricing models already catalogued from supplier rate sheets

04

Safari Offline

The whole trip, vouchers, maps and Tanova's answers keep working in the bush, with no signal.

Built on the trip already being one structured object, retrievable in a single request

05

Connected Camp

The lodge sees what the guest sees — arrival time, dietary needs, changes — the moment they happen.

Built on LuxSav and its operator portal already sharing one platform

06

Border-Smart Journeys

Multi-country trips that know what each crossing needs, days before the guest reaches it.

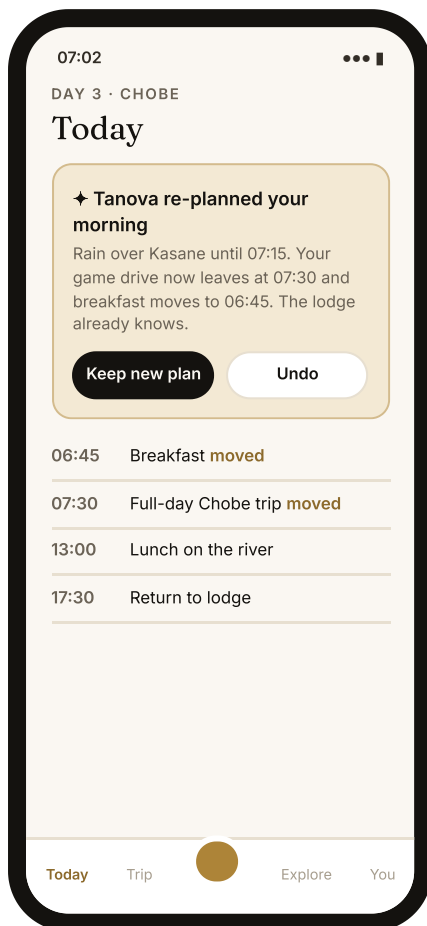

Built on itineraries that already span Victoria Falls, Chobe and beyond in one trip

Behind all six: Tanova

The same concierge in the app and on WhatsApp — the channel travellers in the region already use every day — handing over to a human LuxSav expert with the whole trip in context.

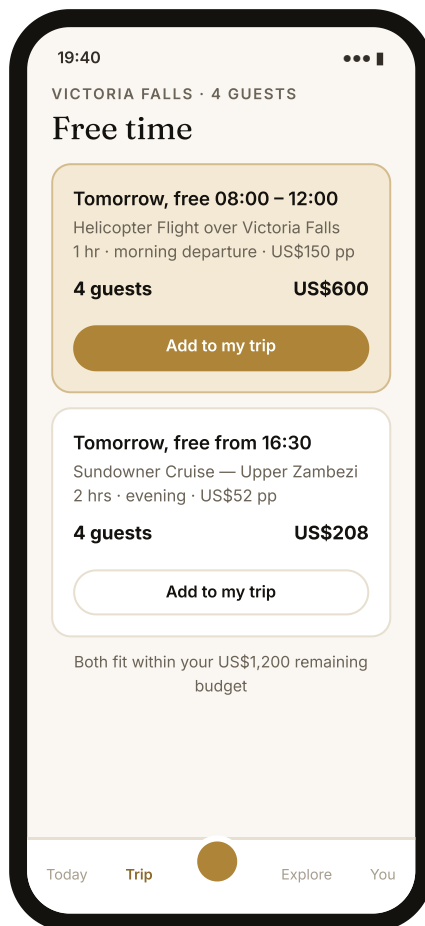

Three moments

What a traveller actually sees. The experiences and prices below are real LuxSav inventory and 2027 supplier rates; the scenarios are illustrative.

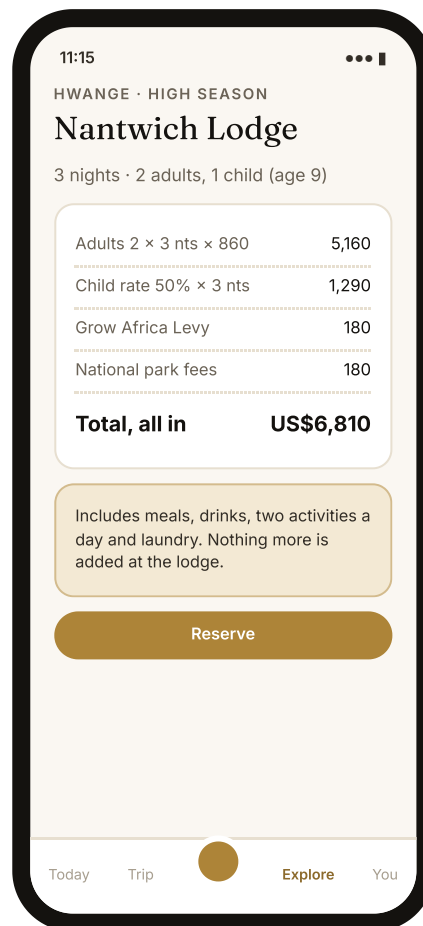

Living Itinerary

No call centre, no rebuilt PDF. One card, one decision.

Gap Commerce

An offer shaped to a specific hole in a specific day — not a banner.

True Price

Four supplier charging rules resolved into one honest number.

THREE RULES EVERY SCREEN FOLLOWS

Tanova proposes, the guest decides

Nothing is booked, moved or charged without one tap. Brass marks anything Tanova suggested.

Every price is the whole price

Where the engine can't yet cover a supplier's full rules, the screen says so instead of guessing.

Assume there's no signal

Anything a guest needs on the day is on the phone already, with the time it was last updated.

01 Living Itinerary

The day re-plans itself — and asks the guest one question.

THE MOMENT

The flight lands ninety minutes late. Before the guest has cleared immigration, Tanova has moved the transfer, pushed back check-in, shifted the afternoon drive to tomorrow and told everyone involved. The guest sees one card: “Your afternoon has been rearranged. Keep it?”

WHY IT'S NEW

Itineraries today are documents. When reality diverges, a person rebuilds them by phone. Here the itinerary is a model of times, durations and dependencies, so it can be solved again in seconds.

WHAT WE BUILD

The trip as a dependency chain (flight → transfer → check-in → activity); triggers from flight status, weather and a “running late” button; a re-planning engine; supplier notifications.

WHAT LUXSAV ALREADY HAS

Tanova already assembles day-by-day plans from each experience's duration and part-of-day slot. Every one of the 248 experiences carries both.

HONEST LIMIT

Suppliers have to accept changes. Version 1: Tanova proposes and a LuxSav concierge confirms within minutes. Automatic confirmation arrives supplier by supplier as live connections land — the booking record already has a field for them.

02 Gap Commerce

Free time becomes the storefront.

THE MOMENT

“You're free from 16:30 tomorrow. The Upper Zambezi sundowner cruise runs two hours and is back before dinner — US\$208 for all four of you, well inside your remaining budget. Add it?”

WHY IT'S NEW

Upselling today is a banner or an email. This is an offer that fits a specific hole in a specific day, for a specific party, inside the money they have left to spend.

WHAT WE BUILD

Gap detection across each day; travel time between points; availability checks; one-tap add that updates the itinerary, the payment and the lodge in a single step.

WHAT LUXSAV ALREADY HAS

Live search on luxsav.com that filters experiences by time window, party size and total budget, and returns party pricing. It was built and deployed this month.

HONEST LIMIT

Travel time needs a location for every experience and lodge — none are stored yet. Suggestions also need real availability, not just the catalogue, before they can be promised.

03 True Price

The real total for this party, before they commit.

THE MOMENT

A family picks Nantwich Lodge for two adults and a nine-year-old. The price on screen is US\$6,810 — accommodation, the child rate, the conservation levy and park fees. Nothing is added at checkout, and nothing is added at the lodge.

WHY IT'S NEW

Southern African pricing is notoriously hard to compare: per person sharing, per room, per unit, whole-camp buy-outs, flat or percentage single supplements, levies charged nightly, per stay or capped. Most platforms show a “from” price and let the invoice sort out the rest.

WHAT WE BUILD

A pricing engine that picks the right model for the party and dates; levy and park-fee tables; a way to load each supplier's new rates every year.

WHAT LUXSAV ALREADY HAS

32 distinct pricing models catalogued from 43 properties' 2027 rate sheets, including capped levies, per-stay fees and age-banded child rates — the hard part of the research is done.

HONEST LIMIT

Rate sheets change annually and need a named owner. Launch with the suppliers already catalogued, and only label a price “all in” where the engine covers that supplier's full model.

04 Safari Offline

Built for the places LuxSav actually sells.

THE MOMENT

No signal at Mana Pools. The guest still opens tomorrow's plan, shows the voucher QR at the gate, and asks Tanova “what time is my pickup?” — and gets the right answer.

WHY IT'S NEW

Travel apps assume connectivity. Many of the camps and parks LuxSav sells have none, which is precisely when a guest most needs their documents and their plan.

WHAT WE BUILD

On-device storage for the trip, vouchers and documents; offline map tiles for the trip's area; an offline Tanova that answers from the downloaded trip; a queue that syncs changes when signal returns.

WHAT LUXSAV ALREADY HAS

The whole trip — days, items, stays and totals — is already one structured object returned by a single API request, which is exactly the shape that can be stored on a device.

HONEST LIMIT

Offline Tanova answers about the trip, not about the wider world. Booking still needs signal — requests wait in the queue and every screen shows when its data was last updated.

05 Connected Camp

Traveller and lodge, looking at the same trip.

THE MOMENT

The guest taps “running 40 minutes late”. The lodge's portal updates, the kitchen holds lunch, the guide moves the drive — and the guest gets a message from the camp itself, not a call centre.

WHY IT'S NEW

Travel apps talk to travellers. Operators find out about changes by email, if at all. Here both sides of the journey look at one live record.

WHAT WE BUILD

An operator view of arriving and in-house guests; live changes and guest notes (dietary needs, celebrations, mobility); two-way messaging tied to the booking.

WHAT LUXSAV ALREADY HAS

LuxSav and its operator portal already run on one shared platform, and the booking record already stores the operator, the sales channel and property-system references.

HONEST LIMIT

The value depends on operators using it. Start with LuxSav's own experiences and the lodges already in the rate book, and measure before expanding.

06 Border-Smart Journeys

Multi-country trips without the anxiety.

THE MOMENT

A Victoria Falls to Chobe day crosses a border and back. Three days before, Tanova checks the passport in the guest's wallet has enough validity and blank pages, explains which visa covers the crossing, and reminds them what to carry for fees.

WHY IT'S NEW

Multi-country trips are where travel in Southern Africa is most complex and where guests are most anxious. Apps treat each country as a separate booking.

WHAT WE BUILD

A per-crossing rules library; document checks against the Wallet; reminders timed to the itinerary rather than the booking date.

WHAT LUXSAV ALREADY HAS

Itineraries and products that already span borders in a single trip — including a three-day Victoria Falls and Chobe package in the live catalogue.

HONEST LIMIT

Border rules change. Every rule needs an owner and a review date, a concierge fallback, and wording that is clearly guidance rather than legal advice.

Tanova, everywhere

The concierge behind all six works in the app and on WhatsApp, with the same trip context in both, and hands over to a human LuxSav expert without the guest repeating themselves. **Limit:** WhatsApp Business requires approval and carries per-conversation costs, so it launches after the in-app version is proven.

Signatures need a great app underneath

The strategy's everyday companion is the floor, not the headline. This is where the purchased UI kit earns its keep — and where it stops.

AREA	WHAT THE TRAVELLER GETS	COMES FROM
Today	Where I am, what's next, weather, pickup, tasks, free-time offers	New build
My Trip	Day-by-day timeline; every item's time, meeting point, voucher, terms, contact	Timeline new · detail from kit
Explore	Categories, search, filters, map, prioritised to the trip's destinations	Kit explore, list, filters, map
Experience & stay detail	Gallery, reviews, rooms, map, True Price	Kit detail + pricing
Booking	Dates, party, payment, instant add to the trip	Kit calendar + payment
Tanova	Planner, chat, actions, human handover	New build
Concierge	Chat, call, WhatsApp, emergency help	New build
Wallet	Tickets, vouchers, QR codes, passport and visa copies, offline	New build
You	Profile, fellow travellers, currency, settings, help	Kit seven profile screens
Sign-in & onboarding	Account, password reset, first-run introduction	Kit UI + backend

What the UI kit is — and isn't

It supplies 24 polished screens: roughly the Explore, detail, booking, profile and onboarding half of the app. It contains no data, no accounts and no live logic — its sign-in simply opens the home screen, its hotels are hard-coded and its map key is a placeholder. Built as-is, it would be as empty as the last APK. Its value is time: it covers the familiar screens so the effort can go into the six signatures, which no kit contains.

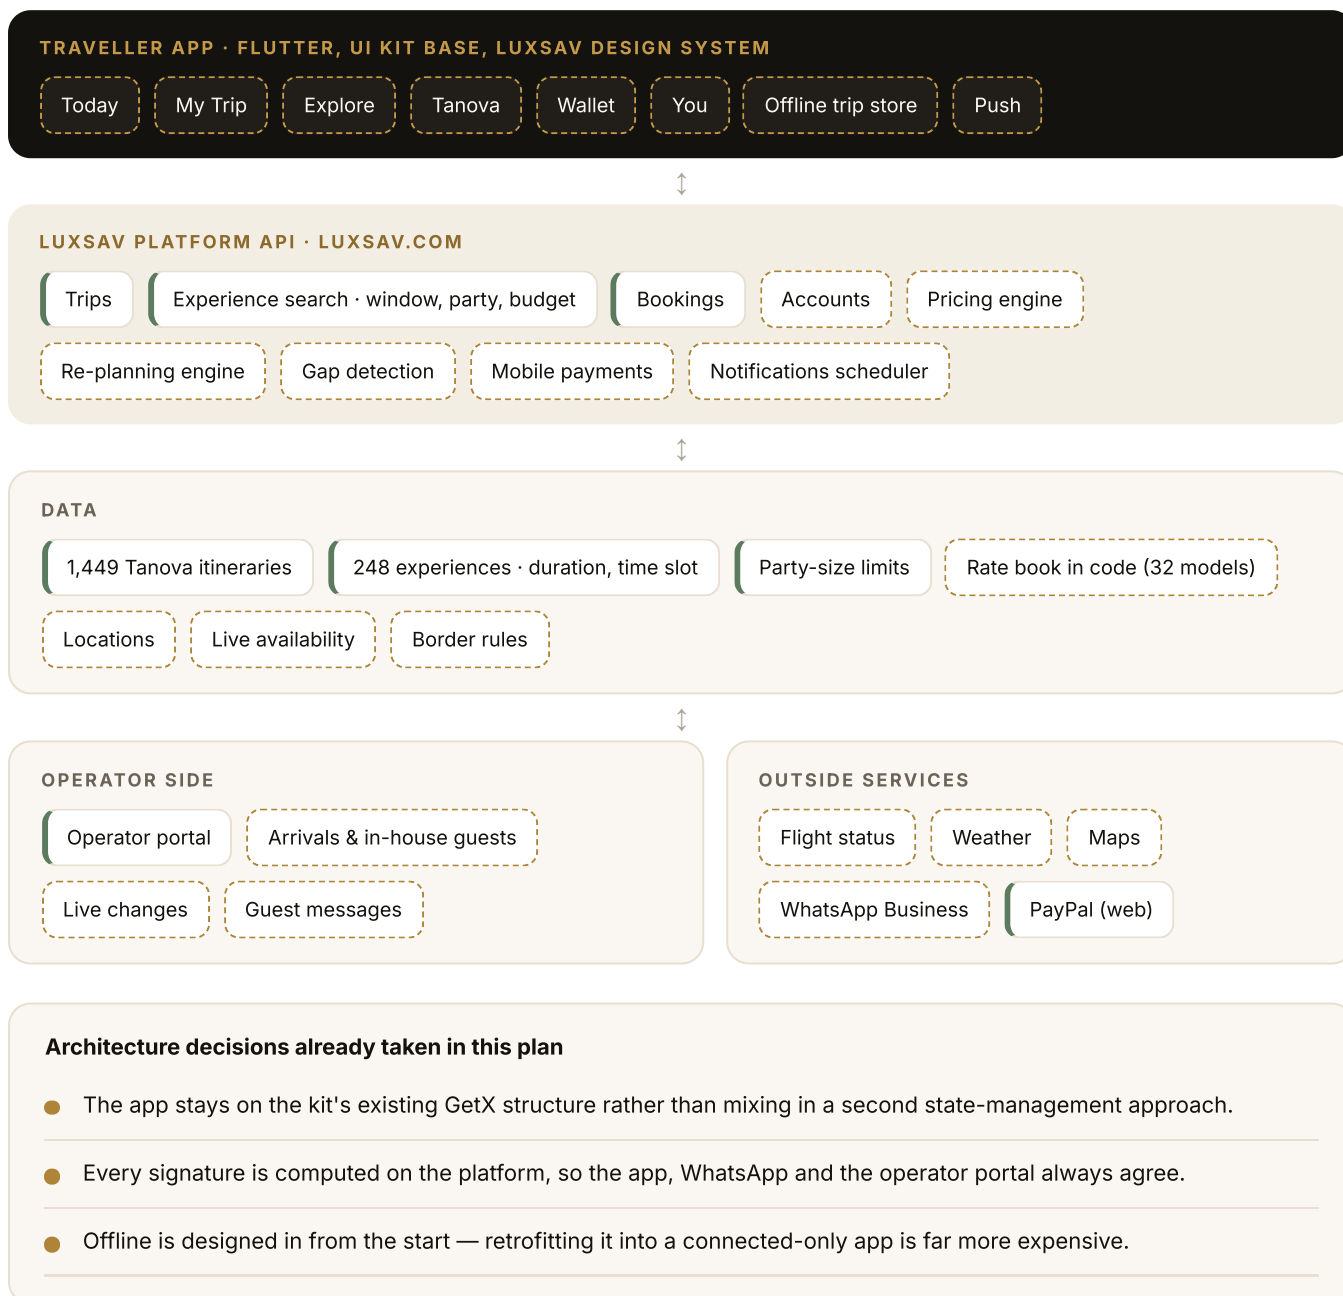

Adapting it

Its colours live in one theme file, so the LuxSav ink-and-brass design system replaces the stock red quickly. The real work is its hotel-shaped data model — 29 files assume a “hotel with rooms per night”, while LuxSav sells stays, experiences, day trips and packages. That model is generalised once, early, rather than patched screen by screen.

One platform, two sides of the journey

The phone is the visible part. The signatures live in the platform behind it — which is why most of the work in this plan is on luxsav.com, not in the app.

☐ Exists today ☐ To build

Foundations

None of these appear in a mock-up, and every signature depends on at least one of them. Checked against the live platform in September 2026.

FOUNDATION	WHERE IT STANDS TODAY	WHAT DEPENDS ON IT
Traveller accounts	None luxsav.com has no sign-in at all. Its 11 user records were created as a side-effect of the payment flow.	Every personal feature: My Trip, Wallet, Today, saved preferences
Locations	None Not one of the 248 experiences has coordinates.	Maps, travel time, Gap Commerce, offline maps
Pricing engine	Researched 32 models catalogued in a spreadsheet, not yet in code.	True Price
Capacity & availability	Partial Party-size limits exist but use a uniform default; no live availability.	Gap Commerce, Living Itinerary
Mobile payments	Web only A server-rendered PayPal flow, repaired this month.	One-tap add, in-app booking
Supplier change channel	Email & phone	Living Itinerary, Connected Camp
Release basics	Missing Maps key, app identity, release signing, iOS build.	Any build a traveller can install
Content owners	Unassigned	Rate sheets, border rules, destination content

One to fix before anything ships

Booking references take the form TSK-2026-074887 — the last six digits of a timestamp — which makes them easy to guess. Any “find my trip” feature must require the matching email as well, and the existing booking lookup should be reviewed for what it returns without one.

Every milestone ends in a phone you can hand to someone

The last build was a shell with sample data. From here, each milestone passes one test: does the phone show something real that a traveller would use? Timings are indicative, assuming one Flutter and one Laravel developer working full-time.

WEEKS 1–4

M1

Real trip in hand

Kit rebranded to LuxSav · five-tab shell · traveller accounts on luxsav.com · Explore and detail on live inventory · My Trips from real Tanova itineraries · maps key and signing

In your hand: sign in, open a real LuxSav trip with its actual days, stays and totals, and browse all 248 live experiences at real prices.

WEEKS 5–10

M2

Free time that sells itself

Today dashboard · day timeline and item detail · locations for the pilot destination · Gap Commerce v1 · Wallet with vouchers and QR · mobile payment

In your hand: a real trip shows its free afternoon, suggests experiences that genuinely fit, and adds one — paid for — to the itinerary.

WEEKS 11–16

M3

True price, even offline

Pricing engine for catalogued suppliers · True Price quotes · Safari Offline · Tanova chat in the app · concierge handover

In your hand: quote a family at Nantwich to the dollar; switch on airplane mode and the trip, vouchers and Tanova's answers still work.

WEEKS 17–22

M4

The day that fixes itself

Living Itinerary v1 (propose, concierge confirms) · flight and weather triggers · push notifications · Connected Camp for LuxSav's own products · Tanova on WhatsApp

In your hand: delay a flight in the test harness and watch the day re-plan, the operator portal update and the guest receive a single card to approve.

WEEKS 23–28

M5

Launch

Border-Smart Journeys for Zimbabwe, Zambia and Botswana · security review · iOS build · store listings · analytics and crash reporting

In your hand: store-ready Android and iOS builds.

What could go wrong, and what we need from you

RISK	HOW THE PLAN HANDLES IT
Suppliers won't accept automated changes	Every change routes through a LuxSav concierge in version 1; automation is switched on supplier by supplier.
Rate data goes out of date	A named owner per supplier; the engine refuses to show "all in" on expired rates.
Operators don't use their side	Start with LuxSav's own experiences; measure before expanding to partner lodges.
Offline answers are wrong	Offline Tanova answers only from the downloaded trip and always shows when it was last updated.
Border rules change	Dated rules with a reviewer, a concierge fallback, and guidance wording — never presented as legal advice.
Six signatures at once is too much	They ship one milestone at a time, and each must pass its "in your hand" test before the next begins.

DECISIONS NEEDED BEFORE M1

- **Account model.** Email and password, phone code, or both? A phone code suits WhatsApp-first travellers.
- **Pilot destination** for locations and Gap Commerce. Victoria Falls is recommended: 51 live experiences and the only top destination where every signature applies — cross-border days, remote camps, offline need. Dubai has more inventory (66) but little use for most of the signatures.
- **In-app payment provider** to sit alongside PayPal.
- **Owners** for the rate book, border rules and destination content.
- **iOS timing** — at launch in M5, or earlier for investor and partner demos.
- **Design system.** Carry the ink-and-brass LuxSav identity across the kit (recommended).
- **Licence.** Confirm the CodeCanyon licence covers this app.

Other apps sell you a trip.
LuxSav runs it.
